### HIGHLIGHTS

- PECs are extrapolated to the CBS limit.
- Convergence of the present calculations is found.
- Effect of SO coupling on the spectroscopic parameters is evaluated.
- Spectroscopic parameters of 16 electronic states and 35 Ω states are obtained.
- Effect of core-valence correlation and scalar relativistic corrections is included.

### GRAPHICAL ABSTRACT

The PECs of 54 Ω states generated from the 22 electronic states of O<sub>2</sub> molecule are studied. Of the 22 states, the X<sup>3</sup>Σ<sub>g</sub><sup>-</sup>, A<sup>3</sup>Δ<sub>u</sub>, A<sup>3</sup>Σ<sub>u</sub><sup>+</sup>, B<sup>3</sup>Σ<sub>u</sub><sup>-</sup>, C<sup>3</sup>Π<sub>g</sub>, a<sup>1</sup>Δ<sub>g</sub>, b<sup>1</sup>Σ<sub>g</sub><sup>+</sup>, c<sup>1</sup>Σ<sub>u</sub><sup>-</sup>, d<sup>1</sup>Π<sub>g</sub>, f<sup>1</sup>Σ<sub>u</sub><sup>+</sup>, 1<sup>3</sup>Π<sub>g</sub>, 1<sup>3</sup>Π<sub>u</sub>, 2<sup>3</sup>Σ<sub>g</sub><sup>-</sup>, 1<sup>3</sup>Σ<sub>u</sub><sup>-</sup> and 2<sup>1</sup>Δ<sub>g</sub> are found to be bound, whereas the 1<sup>3</sup>Σ<sub>g</sub><sup>+</sup>, 2<sup>3</sup>Σ<sub>g</sub><sup>+</sup>, 1<sup>1</sup>Π<sub>u</sub>, 1<sup>3</sup>Δ<sub>g</sub>, 1<sup>3</sup>Π<sub>u</sub> and 2<sup>1</sup>Π<sub>u</sub> are found to be repulsive ones. The B<sup>3</sup>Σ<sub>u</sub><sup>-</sup> and d<sup>1</sup>Π<sub>g</sub> states possess the double well. And the 1<sup>3</sup>Π<sub>u</sub>, C<sup>3</sup>Π<sub>g</sub>, A<sup>3</sup>Δ<sub>u</sub>, 1<sup>3</sup>Δ<sub>g</sub> and 2<sup>3</sup>Σ<sub>g</sub><sup>-</sup> states are the inverted ones. The PECs are calculated by the CASSCF method followed by the icMRCI approach. Core-valence correlation and scalar relativistic corrections are included. All the PECs are extrapolated to the CBS limit. The vibrational properties are discussed for the 1<sup>3</sup>Π<sub>g</sub>, 1<sup>3</sup>Π<sub>u</sub>, d<sup>1</sup>Π<sub>g</sub>, 1<sup>3</sup>Σ<sub>u</sub><sup>-</sup> and B<sup>3</sup>Σ<sub>u</sub><sup>-</sup> states. The SO coupling effect is accounted for. The spectroscopic parameters are evaluated. The present spectroscopic parameters can be expected to be reliably predicted ones. The effect of SO coupling on the spectroscopic parameters are small almost for all the electronic states except for the 1<sup>3</sup>Σ<sub>u</sub><sup>-</sup>, 1<sup>3</sup>Π<sub>g</sub> and 1<sup>3</sup>Π<sub>u</sub>.

PECs of the 11 states of  $O_2$  molecule

1 –  $X^3\Sigma_g^-$ ; 2 –  $b^1\Sigma_u^+$ ; 3 –  $c^1\Sigma_u^-$ ; 4 –  $A^3\Sigma_u^+$ ;  
 5 –  $1^5\Sigma_u^-$ ; 6 –  $1^5\Sigma_g^+$ ; 7 –  $2^5\Sigma_u^+$ ; 8 –  $B^3\Sigma_u^-$ ;  
 9 –  $2^3\Sigma_g^-$ ; 10 –  $2^1\Sigma_u^-$ ; 11 –  $f^1\Sigma_u^+$ .

PECs of the 11 states of  $O_2$  molecule

1 –  $a^1\Delta_g$ ; 2 –  $A'^3\Delta_u$ ; 3 –  $1^5\Pi_g$ ; 4 –  $1^3\Pi_u$ ;  
 5 –  $C^3\Pi_g$ ; 6 –  $1^1\Pi_u$ ; 7 –  $d^1\Pi_g$ ; 8 –  $1^5\Pi_u$ ;  
 9 –  $1^5\Delta_g$ ; 10 –  $2^1\Delta_g$ ; 11 –  $2^1\Pi_u$ .

# **Electron Impact Ionisation**

$$\sigma_{BEB} = \frac{S}{t + u + 1} \left( \frac{1}{2} \left( 1 - \frac{1}{t^2} \right) \ln(t) + 1 - \frac{1}{t} - \frac{\ln(t)}{t + 1} \right)$$

$$S = 4\pi a_0^2 N \left( \frac{R}{B} \right)^2 \quad u = \frac{U}{B}$$

$$t = \frac{T}{B}$$

T is the kinetic energy

B is the binding energy of the electrons in a subshell

U is the average kinetic energy

N is the number of bound electrons with the constants the

R = Rydberg constant

$a_0$  = Bohr radius

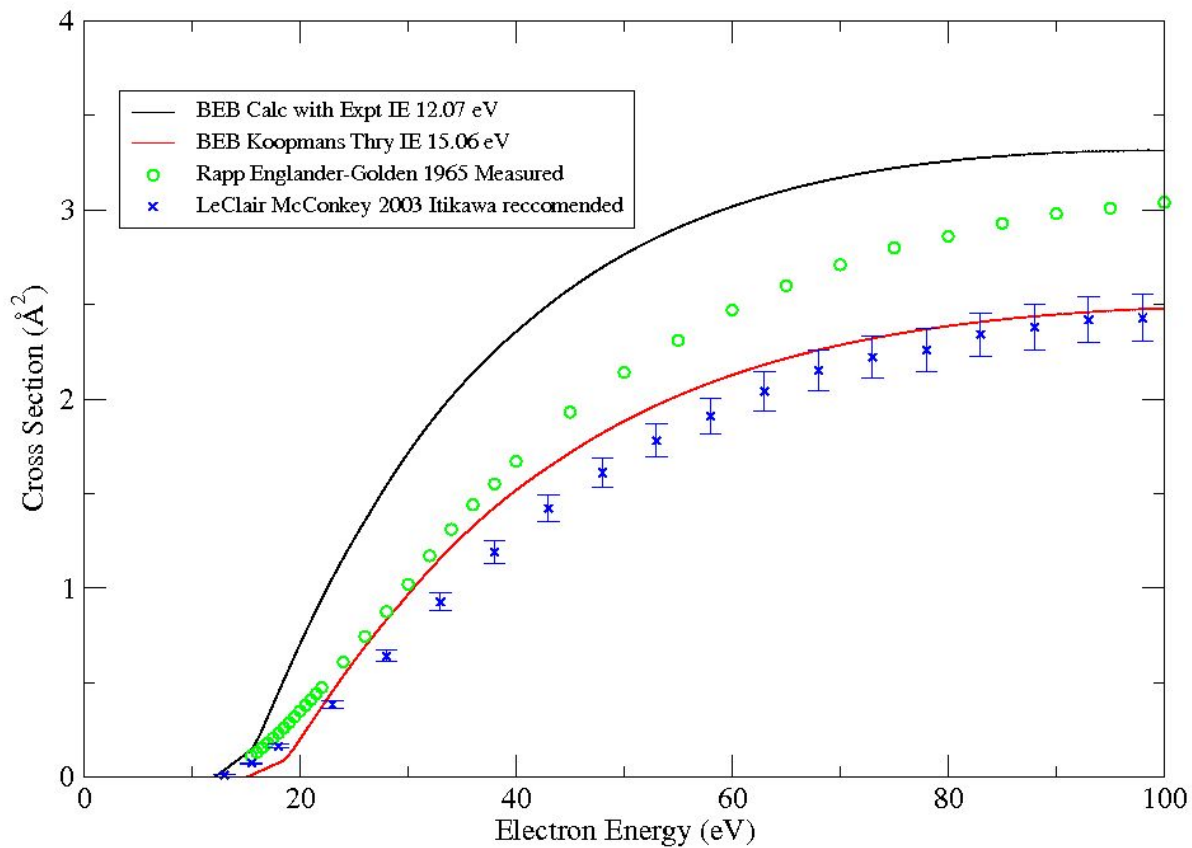

The BEB method has been shown to give reliable total ionisation cross sections for a large range of molecules.
